Cloning and expression of human slap-2: a novel sh2/sh3
domain-containing human slap homologue having immune cell-specific
expression
Patent: WO 0242457-A I 30-MAY-2002;

// note="SH3; Region: SH3 domain. SH3 (Src homology 3)

// note="SH3; Region: SH3 domain. SH3 (Src homology 3)

// domains are often indicative of a protein involved in

signal transduction related to cytoskeletal organization.

First described in the Src cytoplasmic tyrosine kinase.

conciding NOYX (or its complement, fragment or variant). NOYX is NOV1-14, 150, 16a, and 16b. The NOYX polypeptide, nucleic acid encoding it and antibody against it, are useful for treating or preventing (e.g. by gene therapy) a NOYX-associated disorder in humans, e.g. cardiomyopathy, a chercal solution of the preventing or preventing (e.g. by gene thersolerosis, a disorder related to call signal processing and antibolic pathway modulation, diabetes or cancers. The NOYX polypeptide and nucleic acids are also useful for determining the presence of predisposition to the diseases. The NOYX nucleic acid and polypeptide are especially useful in therapeutic or prophylactions for disorders associated with aberzant NOYX expression or activity, e.g. cancers (e.g. adenocarcinoma, lymphoma, prostate cancer or uterus cancers (e.g. adenocarcinoma, lymphoma, prostate cancer or uterus (cancers), immune response, graft-versus-host disease, hypertension, cancers, immunodeficiency syndrome (AIDS), asthma, Crohn's disease, hypertension, congenital heart defects, multiple sclerosis, inflammation or Albright pereditary osteodystrophy and many other diseases listed in the specification. The DNA encoding the protein is useful in gene therapy for treating the conditions. This is also useful in detection assays, or for developing a powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. The present

The invention relates to a substantially purified human SH2/SH3-domain-
containing adapter polypeptide, termed Src-Like Adapter Protein-2 (SLAP-
2). The invention is useful for treating an immune disorder involving
hyperactivity of B- or T- lymphocytes in a mammal. The invention is
useful for screening for antagonists or inhibitors of the interaction of
hSLAP-2 with cellular signalling compounds, for disgnosing, treating or
nolecules which associate with hSLAP-2 and which provide critical signals
or cellular signal transduction, for determining those cellular signalling
molecules which associate with hSLAP-2 and which provide critical signals
or cell activation, and as effectors in methods to affect T cell
activation. The invention is useful in screening assays to identity and
activation. The invention is useful in screening assays to identity and
cettor candidate bloactive agents that modulate hSLAP-2 bloactivity, for
potential use to treat autoimmune diseases which may be caused
by hyperactivated B cells, in addition to other immune system related
conditions, diseases and conditions, theumatoid arthritis,
osteoarthritis, psoriasis, rhinitis, inflammatory bowel disease (Crohn's
and ulearative collish), and T-cells and B-cell moplasms,
inflammation disorders, diseases and conditions, theumatory disease such as systemic lupus
ast cells or eosinophils, autoimmune diseases such as systemic lupus
asthma, acute respiratory distress syndrome, and chronic obstructive
cuseful in gene therapy. The present sequence is human SLAP-2 CDNA
                                                                                                        ng adapter
therapeutic
                                                                                                   Novel substantially purified human SH2/SH3-domain-containing adapter polypeptide, termed Src-Like Adapter Protein-2, useful for therapeut intervention in immunological and inflammatory disorders and cancer.
                                                                                                                                                                                                            Claim 2; Fig 1; 85pp; English

The present sequence encodes the human Src-like inhibitory molecule (SLIM) protein (1). The present invention describes a SLIM protein comprising an N-terminal myristylation sequence, an N-terminal SH2 domain, and an N-terminal SH3 domain which can bind to Cbl, or comprising an N-terminal myristylation sequence and an N-terminal SH2 domain which is unable to bind to Cbl. (1) has antiinflammatory, immunosuppressive and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        121 GCCAGTTTCCCGGCCAGGTGGCCCGGCCGAGCTGTCGCTGAGACTCGGGGAGCCATTGACC 180
                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises the amino acid and coding sequences of modulator of antigen receptor signalling (MARS) proteins. The MARS protein is a putative tumour suppressor game and exhibits structural and sequence similarity to the Sor-like adaptor protein (SLAP). The MARS DNA and protein sequences of the invention are useful for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                myeloid malignancies (e.g. acute myelogenous leukaemia) autoimmune disorders, immunosuppression, myeloproliferative disorders and malignancies related to the de-regulation of tyrosine kinases (e.g. breast cancer). The present CDNA sequence encodes a human MARS protein

                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel human ORFX polypeptides and their coding sequences (ABP63631-ABP64681 and ABQ98194-ABQ99267). The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HVDE) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, blood congulation disorders or inflammatory disorders. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site at
New polypeptide designated ORFX are present in human atherogenic cells and are useful to prevent and treat ORFX-associated disorders including cancer, allergy, wound healing or autoimmune, cardiovascular or inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: oytostatic, hepatotropic; vulnerary; actipacialist; antiparkinsonian; nootropic; neuroprotective; osteopathic; antipachiant; immunosuppressant; immunostimulant; cardiant; htmombolytic; cagaliant; passtropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidifamentory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors: The proteins and nucleic acids may be used to treat cancers, proliferative disorders, cardiovascular disease, disorders, osteoarthritis, graft vs host disease, cardiovascular disease, storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID) AIDS, viral, bacterial or fungal infection, malaria, autoimmune cartialage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    558

The present invention relates to novel human coding sequences (ABQ99268-ABQ9608) and proteins (ABP64682-ABP6502). The sequences are useful in thereared in the field of molecular biology as hybridisation probes, primers consequence, for PCR, for chromosome and gene mapping, for the recombinant production of protein, or in generation of anti-sense DNA or RNA. The proteins are useful in diagnostics as expressed sequence tags of protein, or in generation of anti-sense DNA or RNA. The production of anti-sense dense or for physical mapping of the human genome. The proteins may be used as molecular weight markers, or as nutritional sources or supplements. The proteins way be used to maintain condexisted or supplements. The proteins may be used to maintain condexides and proteins are useful for preventing is transplantation, manufacture of bio-pharmaceuticals or the development of bio-sensors. The cuseful for preventing broteins are useful for preventing, treating or amelioration disorders involving aberrant protein expression or biological activity, e.g. haematopoietic disorders, central/peripheral cuseful, bacterial or fungal infection, autoimmune disorders, allergic reactions and conditions, coagaliation disorders, infectious diseases caused by viral, bacterial or fungal infection, autoimmune disorders, allergic conditions and conditions, coagaliation disorders, or cancer. The sequence of the invention were assembled from STFs isolated mainly by sequencing by hybridisation, and in some cases, cata for this patent did not form at at the printed specification, but manner disorders and in some cases. The sequence of the invention were assembled from the sequence of the invention and in some cases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    644

The MARS protein is a putative tumour suppressor gene and exhibits structural and sequence similarity to the Scr-like adaptor protein (SLAP). The MARS DNA and protein sequences of the invention are useful for the treatment of myeloid malignancies (e.g. acute myelogenous leukaemia) autoimmune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polymucleotide (1) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain relates to figures, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a stivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a subplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful activity. The polypeptide and polymucleoride sequences have applications in diagnostics forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences. AAS64197-AAS94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in the vinted specification, but was obtained in the vinted specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating till and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                  1111 TGAGGGTCTCCGGGAGTCCCTCAGCTTCTACATCAGCCTGAATGACGAGGCTGTCTTT
